Hiring Executive
Task Athena

May 28, 2025

Dear Hiring Executive,

I am an enrolled Computer Science student with a long-standing interest in agentic systems, automation, and practical AI tooling. For over a decade, I have operated a service business where I identified and solved operational problems, and designed systems using technologies I taught myself. Task Athena's mission to build intelligent systems for businesses reflects exactly the kind of work I've already been doing, and am now aspiring to pursue more formally.

One of my most relevant contributions is the conceptual design of an agentic AI system modeled as an advisory board. In this project, I defined the behavioral logic and recursive interaction patterns of LLM-based agents, each configured to reflect a distinct persona. A certified AI architect implemented the system based on my original design. This experience sharpened my understanding of persona modeling, reasoning flows, and applied system architecture using large language models.

In my own business, I am currently developing a self-booking scheduling system using React and the Google Calendar API. I am using ChatGPT as a coding assistant throughout the build process, both to accelerate development and to deepen my practical understanding of component-based design. I've also deployed Zapier automations, built marketing funnels, managed SEO and paid ad campaigns, and used analytics platforms like Hotjar and Google Analytics to improve user experience and conversion performance.

Task Athena's focus on real-world tools, automation, and reasoning-based AI aligns directly with both my background and my current trajectory. I would welcome the opportunity to contribute to your team and to help build systems that create meaningful value for businesses.

Sincerely,
Tyler Prince
