Dear Hiring Manager,

Having been captivated by Torch.AI's commitment to pioneering data infrastructure for U.S. Defense and National Security, I am well-positioned to bring my experience in software engineering/ML and Python programming to this mission. In previous projects, I've successfully architected a modular, enterprise-style pipeline integrating Azure Functions, Data Lake, and other technologies for scalable data processing. This work aligns seamlessly with the responsibilities of a Junior AI/ML Engineer at Torch.AI, particularly the implementation and maintenance of ML models using frameworks like PyTorch.

Moreover, my work on developing a retrieval-augmented generation (RAG) workflow utilizing semantic search and vector embeddings has honed my skills in model training and evaluation workflows – crucial capabilities for your role. Leveraging these experiences, I'm excited about the potential to contribute towards building software that scales across Torch.AI's platform capabilities.

Beyond technical expertise, my strong problem-solving abilities and eagerness to learn from peers make me an ideal fit for your collaborative environment. I look forward to potentially advancing back-end data orchestration at Torch.AI, while also introducing innovative new iterative capabilities and features. Let's explore how we might further each other's missions.

Sincerely,
Tyler Prince
